

Reactiv SUITE

PRODUCT FAMILY

Because your needs differ from the boardroom to your home office. Reactiv SUITE is available in different configurations, specifically optimized for your environment.

Product Configurations

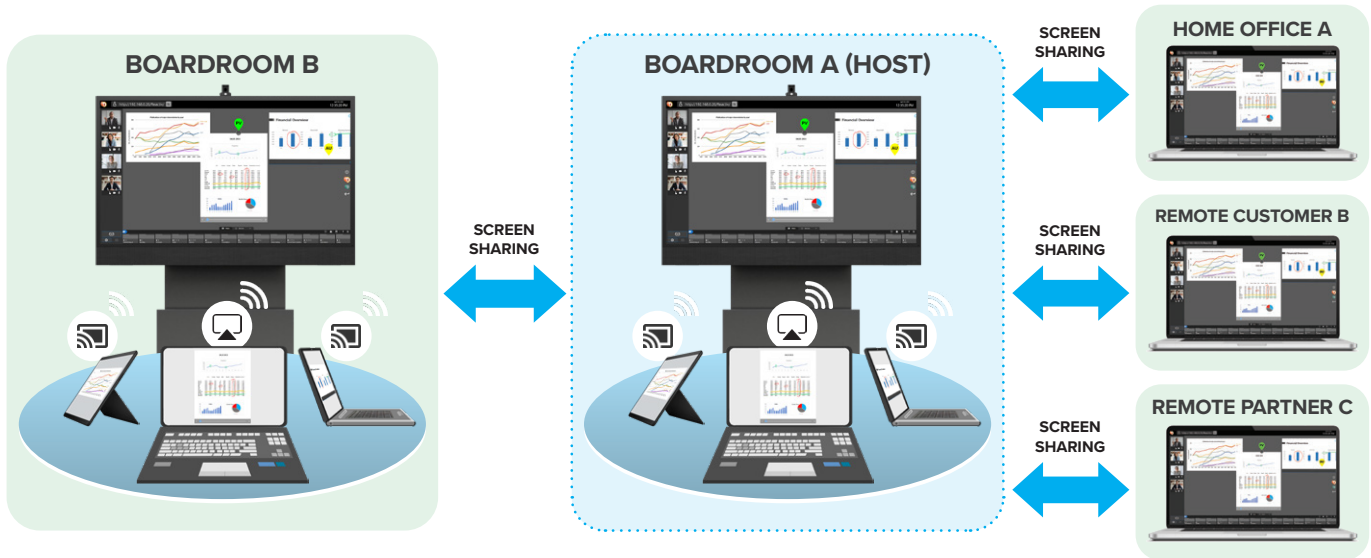

Reactiv SUITE is a software ecosystem, built for different types of meetings and environments, designed to be the 'operating system' for your collaboration.

This eco-system is composed of multiple applications that enhance and provide the workflows involved in various meetings such as presentation, ideation and remote collaboration sessions. In addition, services and extensions are integrated that allow different formats and sources of data to be unlocked, processed and displayed - depending on how the end user is accessing Reactiv.

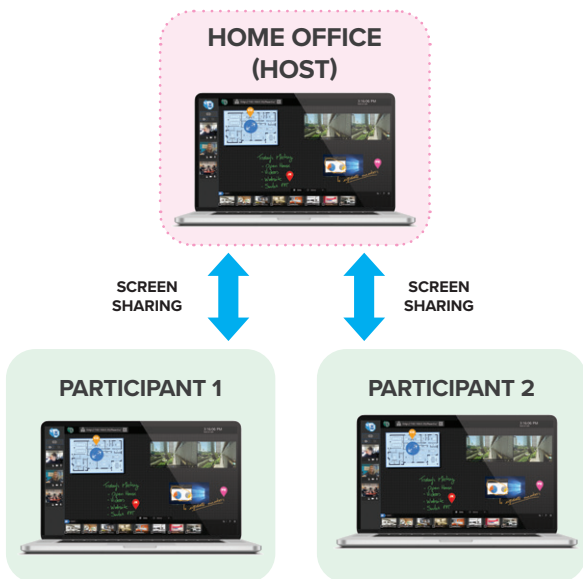

Reactiv SUITE is available in multiple configurations - each optimized for different types of hardware endpoints; laptops for personal use in a home office, versus Interactive White Boards for use in public spaces such as conference and huddle rooms. Together, Reactiv IWB and PRO create a seamless experience for all users in any work environment, allowing local and remote employees, partners and customers to simultaneously collaborate and participate as if they were sitting across the table.

Classroom

Reactiv SUITE IWB

Designed For Shared Spaces

The perfect solution for multiple people to use Reactiv SUITE, throughout the day, in public spaces such as boardrooms, conference rooms and huddle rooms. This configuration integrates key features that allow the solution to operate, be configured and managed in these environments.

Reactiv SUITE IWB natively integrates several authentication protocols which facilitate individual user access to data. Users can log in to existing authentication databases like Active Directory or Office 365, and seamlessly access their workspaces regardless of what room they use. This allows trusted users full access to their data on the network, while restricting guests to limited access.

Additionally, Reactiv SUITE IWB natively supports a variety of peripheral devices attached to the IWB or installed in the Boardroom. Multiple microphones A/V sources, projectors and various secondary displays can be managed, configured and supported directly within the software.

Reactiv SUITE IWB provides the ability for a multitude of personal in-room devices, from laptops and mobile to tablets, to share their screens, drop files and folders and even enter keystrokes directly into the software.

Reactiv IWB is designed to simplify rollout across the corporation, minimising support and IT headaches.

Key Features

- ▶ Shared space edition
- ▶ Multi-user authentication
- ▶ Boardroom hardware, A/V Integration
- ▶ In-room device sharing and connectivity
- ▶ Optimized for pen and multi-touch

Reactiv SUITE PRO

Designed For Personal Devices

Reactiv SUITE PRO is designed with a single user in mind. It offers the same applications, user functionalities and workflows but reduces various connectivity and peripheral interoperability capabilities, which are not pertinent in a home office environment.

The user will login to the underlying operating system using their own credentials and unlock all network resources outside of the Reactiv SUITE environment. Reactiv leverages the existing user rights, just like any other Windows based application.

In addition, Reactiv SUITE PRO severely restricts connectivity options like File Drop and connectivity services in order to minimize security risks on a personal device.

Corporate IT will approve and install Reactiv SUITE PRO just like any other application. Users can also leverage existing VPN connections and applications on their personal devices and are not required to change their workflows.

Key Features

- ▶ Personal edition
- ▶ Single user, Windows user
- ▶ Optimized for keyboard and mouse

What Is Included

	IWB	PRO
